

The FCC should protect long-time existing school and community Non-commercial FM Educational stations from interference by newer non-commercial licensees and LPFM applicants. The practice of allowing non-commercial applicants to use their own engineering studies to squeeze into the non-commercial FM band is increasing interference and reducing the ability of existing community and school stations to serve the local community. Over the past several years, the FCC granted licenses on our existing frequency--in apparent violation of past standards. This has led to interference with our coverage in our city of license and the blocking of our coverage to surrounding areas, which we had previously served. WQNA 88.3 FM Springfield, IL.
